There are many things you can do for your photos with a single click in your photo editing program. Last week, for example, I showed you how you can use the color replacement tool in Adobe Photoshop Elements to change specific colors in an image. And in the past, I explained how easy it is to convert any photo into a stylish black and white composition by setting the saturation to 0 in any image equal. In Adobe Photoshop Elements, you can use the Remove Color command (found in the Enhance, Adjust Color, Remove Color menu) to convert photos to black and white in one step. This week, combine that with a small Layers action to give you more control over the look and feel of your black and white photos. As usual, I'll show you how to do this in Photoshop Elements – although the steps are basically the same in any photo editor that supports layers. Start by opening a photo that you want to turn into a black and white color. But don't go straight to the Remove Color command. Instead, copy the picture in a new layer first. To do that, select Layer, Duplicate Layer from the menu, and then click OK. You'll see two copies of the photo in the Palette Layers on the right side of the screen. Now we are ready for the black and white chemistry of the photo. Make sure the top layer is selected in the Palette Layer, and then choose Enhance, Adjust Color, Remove Color. The photo will turn black and white - but if you glance at the Palette layer, you'll notice that the bottom layer is still colored. This is where we get tricky. We'll tweak the black and white version of the image by editing the basic color layer. Go back to the Palette Layer and change the blend mode from Normal to Hue. This will allow you to edit the top layer in black and white by being naughty with aspects of the colour image below, such as Hue and Saturation. The color of the color layer will directly notify the final tone of the black and white image. To try this, click on the bottom layer - the layer is still colored --and select Enhance, Adjust Color, Adjust Hue/Saturation. Now you can change the color and saturation of your bottom layer, and see the effect on the black and white layer. That's not all. With the bottom layer still selected, select Advanced, Adjust Light, Brightness/Contrast. Keep in mind that when you move the brightness and contrast slider, you may see the effect on the last black and white image in real time. When you're happy with your photo, you can combine layers (right-click on a layer in the Palette Layer and choose Flatten Layers) and save the image as JPEG. Here you can see how this image evolved from color to black and white to advanced black and white using layer adjustments. Original color image. Simple black and white images. The black and white image is enhanced with layers. Published, returned to famous! Each week, we choose photos submitted by readers based on creativity, originality, and technique.
